Build Mobile Apps Using JavaScript & React

Jackline Kamal

nativewind

<https://www.nativewind.dev>

**run this command to create project with
nativewind**

```
npx create-expo-stack@latest --nativewind
```

1- SafeAreaView

```
npx expo install react-native-safe-area-context
```

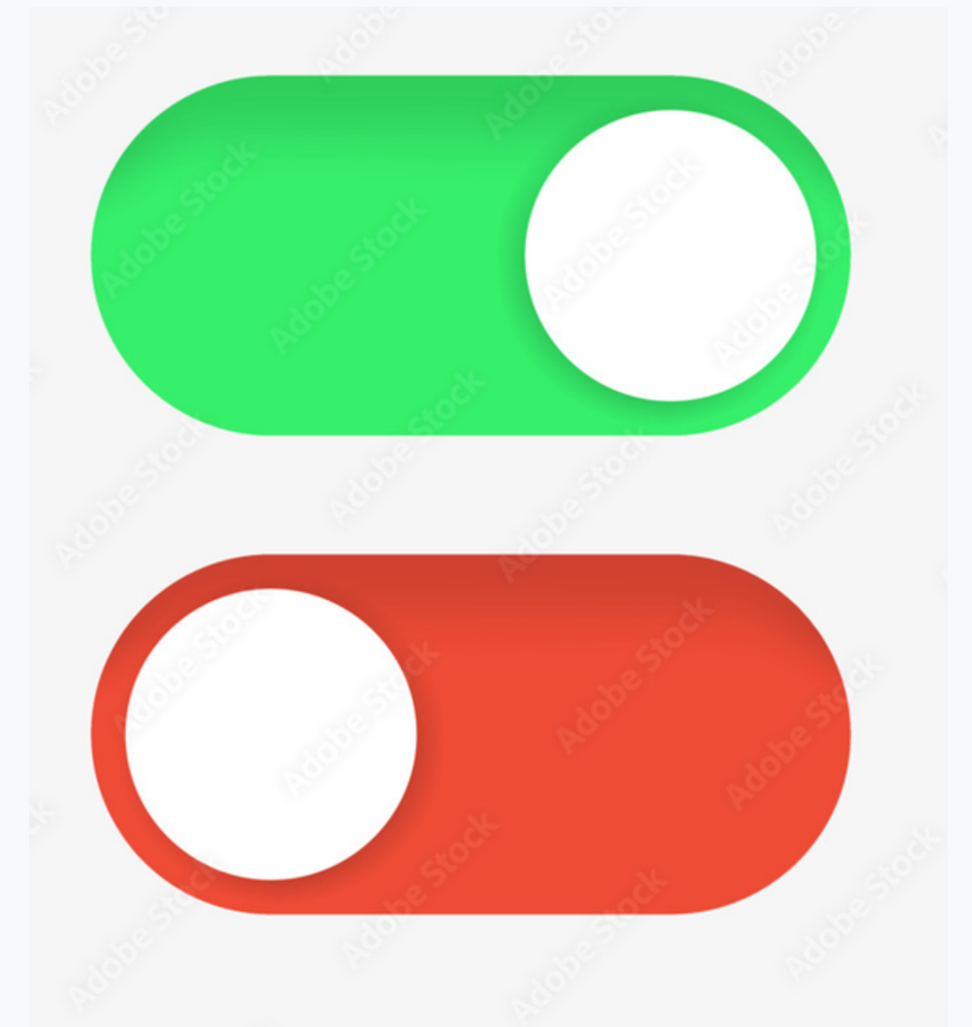

SafeAreaView is a special component in React Native that makes sure your content stays inside the safe area of the screen — so nothing gets hidden behind:

- the notch
- the status bar
- the rounded corners
- the home indicator (bottom bar on iPhone)
- the Dynamic Island

2- Switch

```
<Switch  
  value={isActive}  
  onChange={toggleSwitch}  
  onValueChange={setIsActive}  
  trackColor={{false:"black",true:"lightgreen"}}  
  thumbColor={isActive?"green":"grey"}  
  
>
```

4- Use Axios To Fetch Data

`npm i axios`

<https://dummyjson.com/users>

3- FlatList

```
<FlatList
  data={}
  numColumns={1}
  ListHeaderComponent={}
  onRefresh={}
  refreshing={}
  onEndReached={()=>{}}
  keyExtractor={({item})=>{}}
  ListEmptyComponent={}
  renderItem={({ item }) => }
/>
```
