Build Mobile Apps Using JavaScript & React

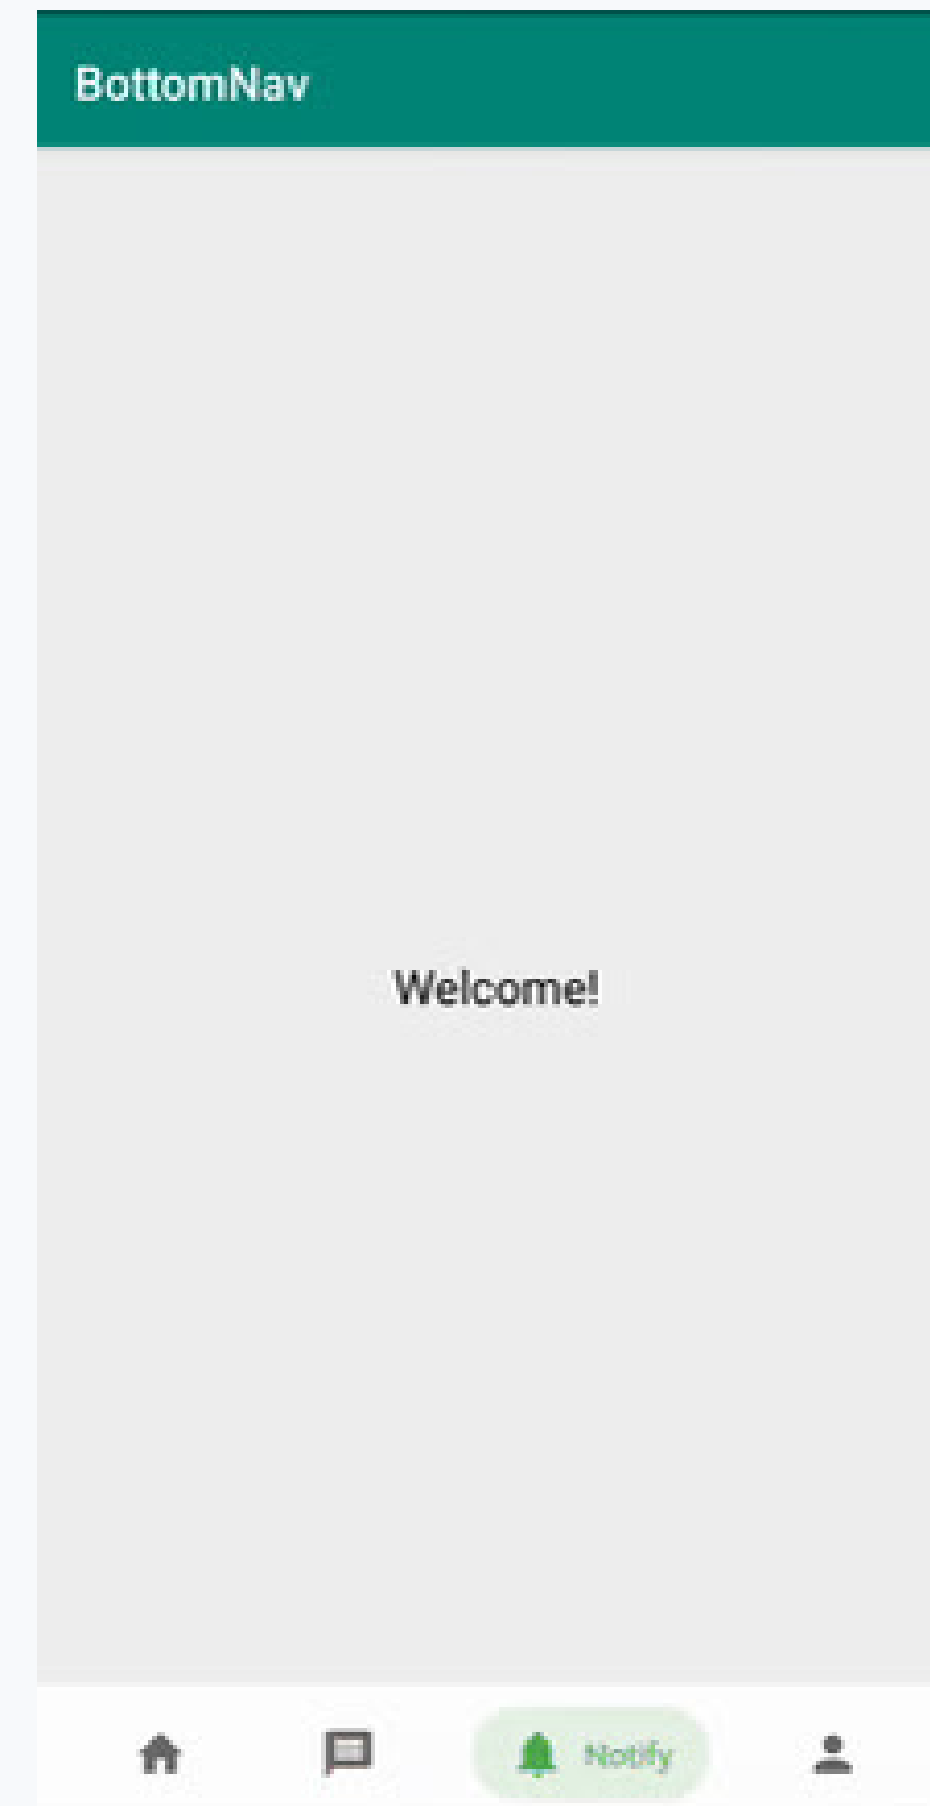

Jackline Kamal

1- Stack Navigation

2- Bottom Navigation

3- Top Navigation

Installation:

1- `npm install @react-navigation/native`
 or
`npx expo install @react-navigation/native`

This is the core package for React Navigation, which provides the foundation for all types of navigation (stack, tab, drawer, etc.) in your app. It manages navigation state, handles navigation transitions, and provides tools for linking navigation actions to your app.

Installation:

2- `npm install react-native-screens`
 or
 `npx expo install react-native-screens`

This library optimizes screen rendering in native navigation by using native navigation primitives. It improves performance by using the underlying native navigation API to manage the screen lifecycle more efficiently. It's especially useful for large apps with many screens.

Installation:

3- `npm install react-native-safe-area-context`

This library helps in managing safe areas in your app, ensuring that UI elements are properly rendered without overlapping system UI elements (like the notch on iPhones, or status bars). It's crucial for providing a good user experience across different devices.

1. setting up stack navigation:

```
import { NavigationContainer } from '@react-navigation/native';
import { createNativeStackNavigator } from '@react-navigation/native-stack';

const Stack = createNativeStackNavigator();

function App(){
  return (
    <NavigationContainer>
      <Stack.Navigator>
        <Stack.Screen name="Home" component={HomeScreen} />
        <Stack.Screen name="Details" component={DetailsScreen} />
      </Stack.Navigator>
    </NavigationContainer>
  );
}
```

screenOptions:{{}}

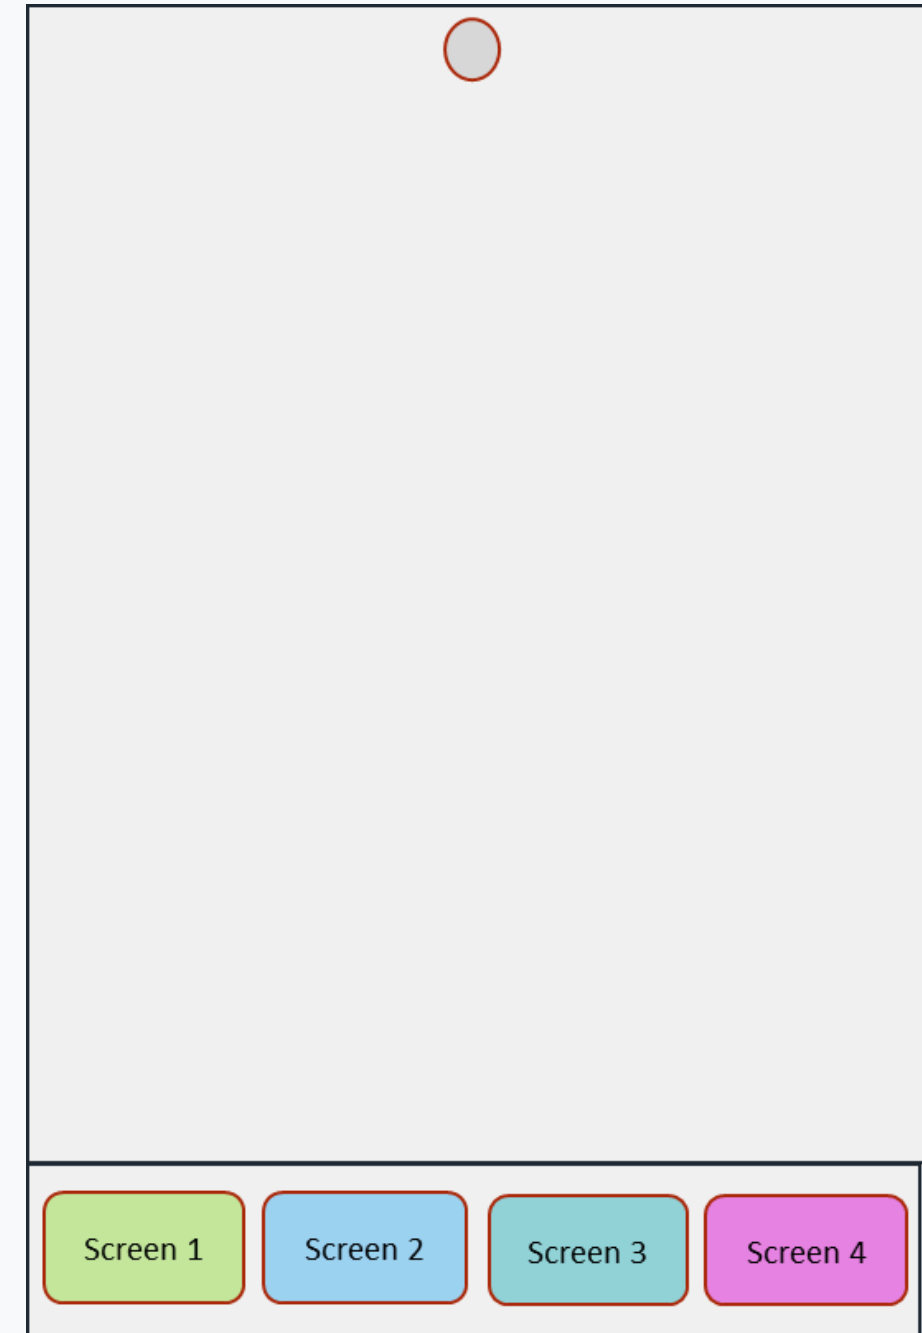

```
headerTitle ,  
headerTintColor,  
headerTitleStyle,  
headerTitleContainerStyle,
```

```
headerShown  
headerStyle ,  
headerBackground,  
headerLeft  
headerRight  
header ,
```

2. Bottom Tab Navigation

Installation:

```
npx expo install @react-navigation/bottom-tabs
```

2. setting up stack navigation:

```
import { NavigationContainer } from '@react-navigation/native';
import { createBottomTabNavigator } from "@react-navigation/bottom-tabs";

const Tab = createBottomTabNavigator();

function App(){
  return (
    <NavigationContainer>
    <Tab.Navigator>
    <Tab.Screen name="Home" component={HomeScreen} />
    < Tab.Screen name="Details" component={DetailsScreen} /> </Tab.Navigator>
    </NavigationContainer>
  );
}
```

screenOptions:{{}}

tabBarLabel

tabBarLabelStyle

tabBarIcon

tabBarBadge

tabBarIcon

tabBarShowLabel

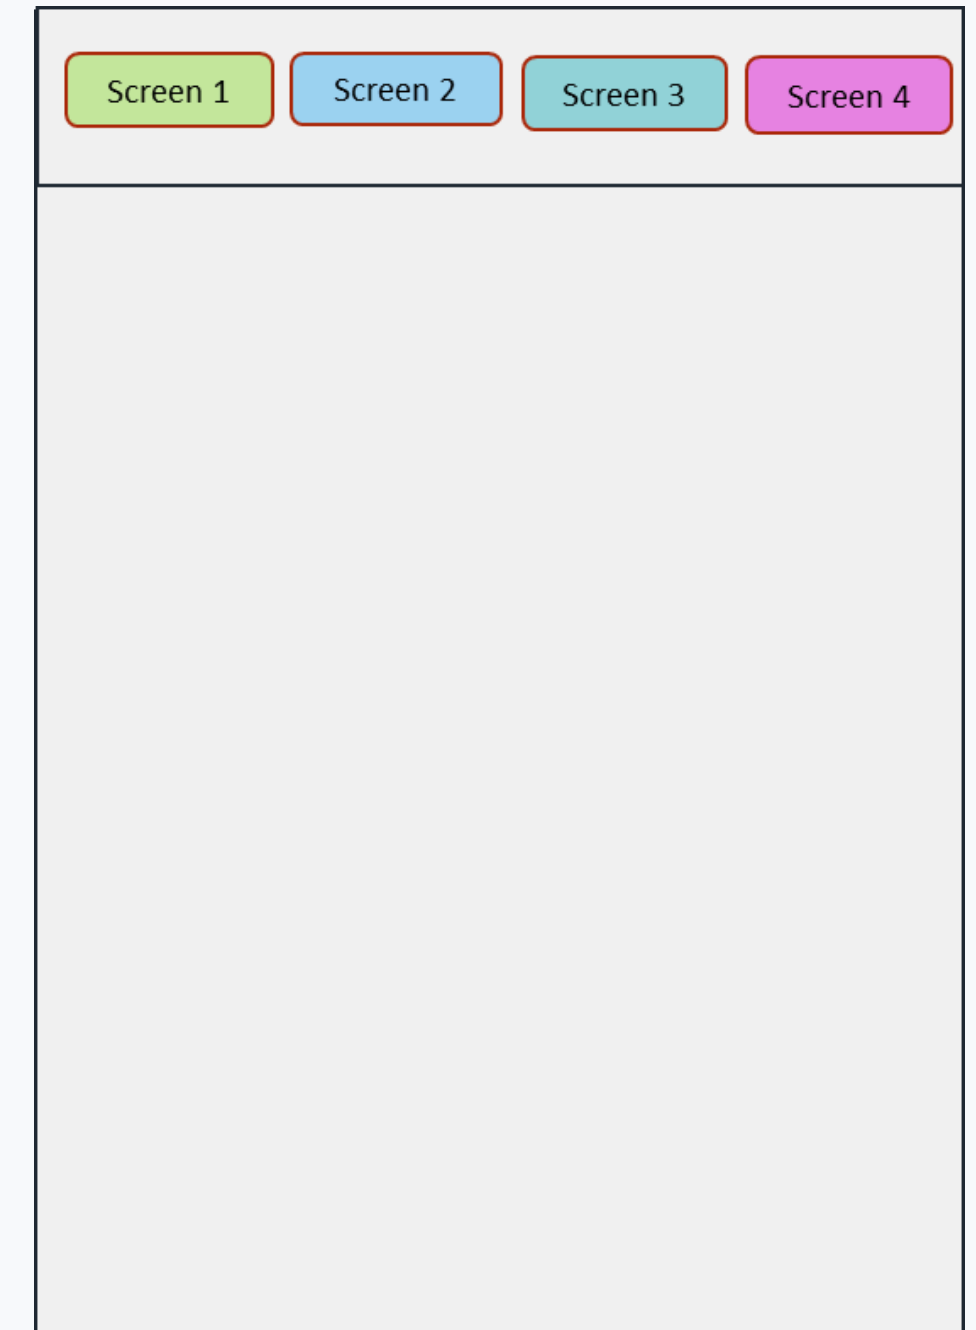

tabBarActiveTintColor

tabBarInactiveTintColor

3. TopTab Navigation

Installation:

```
npm i @react-navigation/material-top-tabs
```

3. setting up Topnavigation:

```
import { NavigationContainer } from '@react-navigation/native';
import { createMaterialTopTabNavigator } from '@react-navigation/material-top-tabs';

const Top = createMaterialTopTabNavigator();

function App(){
  return (
    <NavigationContainer>
    <Tab.Navigator>
      <Tab.Screen name="Home" component={Home} />
      <Tab.Screen name="About" component={AboutUs} />
      <Tab.Screen name="Contact" component={ContactUs} />
    </Tab.Navigator>
    </NavigationContainer>
  );}
```
